

Easily deployable, hyperspectral sensors are used to reveal secrets of famous documents such as the Gettysburg Address, ancient maps, and archeological artifacts such as pottery shards (ostracons) that represent the oldest known representation of Hebrew writing.

Hyperspectral imagers offer researchers and scientists unique advantages:

- Forensic analysis & validation of documents and artifacts
- Discover original intent elements & authenticity
- Identify regions for restoration
- Assess original coloring and pigmentation
- Enhance faded or hidden attributes

Since no preparation of the document or artifact is necessary, this non-destructive spectral technique is invaluable for a wide range of historical research relating to changes in color, chemical and substrates. Within the field of view of the Hyperspec[®] sensor, hyperspectral imaging simultaneously yields precise information for all wavelengths across the complete spectral range of the sensor. With the creation of the hyperspectral datacube, a data set that includes all of the spatial and spectral information within the field of view, research teams are able to more thoroughly evaluate documents and other artifacts that will greatly enhance knowledge of the spectral composition and uniqueness of these samples.

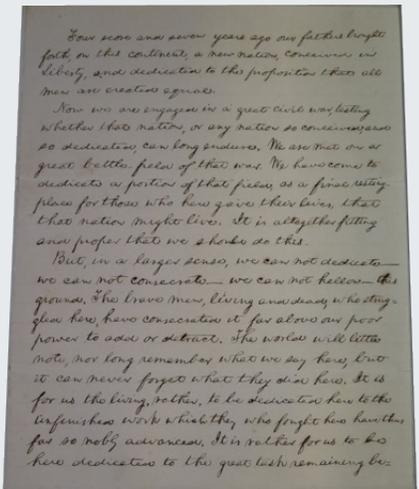

Hyperspec Starter Kit

Within the field of view of the Hyperspec[®] sensor, hyperspectral imaging simultaneously yields precise information for all wavelengths across the complete spectral range of the sensor. With the creation of the hyperspectral datacube, a data set that includes all of the spatial and spectral information within the field of view, research teams are able to more thoroughly evaluate documents and other artifacts that will greatly enhance knowledge of the spectral composition and uniqueness of these samples.

Headwall's Hyperspec[®] Starter Kits are available in both standard and large-format configurations. These systems represent complete, turnkey solutions that can be easily adapted to any of Headwall's Hyperspec sensors...from UV-VIS up to the SWIR spectral range. Each kit contains gantry, moving stage, proper illumination for the spectral range of interest, and Headwall's Hyperspec[®] III software.

PRECISION SPECTRAL ANALYSIS OF DOCUMENTS AND ARTIFACTS

Headwall specializes in hyperspectral imagers that precisely analyze color and chemical composition useful for the detection and measurement of changes while also examining repairs and restorations. Headwall's Hyperspec[®] sensors are available for the VIS (380-825nm), VNIR (380-1000nm), Extended VNIR (550-1700nm), NIR (900-1700nm), SWIR (950-2500nm) ranges and beyond. These sensors are used in conjunction with Headwall's advanced and easy to use Hyperspec[®] III software.
